ON-DEMAND WEBINAR

RSV, COVID, & Influenza in Children

Tanya Spence,
RN, BScN, MN

Description:

Sniffing, sneezing and wheezing in kids...how do you know what's causing it? RSV, COVID and Influenza all have respiratory symptoms, but how do you tell the difference? And what are the nursing implications of each? While the triple-demic isn't a scientifically accepted term, last year it vividly described the triple threat that children faced. All three have different modes of transmission and different symptoms, which can be subtle, so knowing how to differentiate them, can make a difference especially when respiration symptoms turn into respiratory distress. Join Tanya Spence, a pediatric nurse with many years of experience in critical care to learn the differences and how to assess kids with RSV, COVID and Influenza; learn the different treatment course is, when to advise parents to seek medical attention and we'll review some case studies to enhance your learning.

RSV COVID & FLU IN KIDS

Includes:

- 2 hours of Continuing Education
- On-Demand Access for at Least a Year
- Certificate of Completion
- PDF handouts to view or print

\$39 + GST
